# Application Security

**Exercise Set 3, Grizzlies**

1. Check and present the options of any of cloud environments (e.g. Azure or AWS) from the security perspective (e.g. configuration files, files permissions, service accounts). Verify whether the default configuration is secure and if not, what needs to be fixed.
   **[5p]**

2. Find several most popular Python/Django/Flask plugins/libraries. Find and describe 2 vulnerabilities in previous versions (which hopefully have been patched so far).
   **[5p]**
