Programming Applications with Databases

Exercise Set 11

1. Using prepared previously prototypes (or mockups) create a basic version of the user interface. At this stage a set of CRUD operations should be implemented for at least one aggregate and supported by the following views:

   - List of items with the possibility to delete the selected item.
   - Forms for adding and editing items.

   At this stage input validation, authentication or authorization are not required.

   Application can be created in any technology and as any type (e.g. classic web site, SPA, desktop, mobile, etc.) if only the mockups can be implemented.
