Programming Applications with Databases

Exercise Set 13

1. Prepare at least 4 business validation rules and implement them in the domain model using the library FluentValidation (or analogous in the other technology).
   [**2p**]

2. Ensure that the 4 business validation rules are also implemented in the UI using the vendor's approach for validation. Please ensure the logic is consistent between those implementations.
   [**2p**]

3. Add one more validation rule to the UI (it supposed to be UI specific) using the vendor's approach for validation which require AJAX requests.
   [**1p**]

4. Create and implement a REST API which exposes a selected entity (e.g. Product) and allows to manipulate it. Ensure the design according to the REST principles.
   [**3p**]

5. Prepare in Postman a set of 6 example requests to the API created in the previous exercise covering different possible usages.
   [**2p**]
